## About ubitricity Gesellschaft für verteilte Energiesysteme mbH

Charging e-vehicles with energy from renewable resources wherever they are parked was the goal when ubitricity was founded. The company is now one of the leading providers of intelligent solutions for charging and billing electric cars with its lamp post charge points. ubitricity develops technology that meets the quality standard "made in Germany".

## Lamp post charging: the innovative approach by ubitricity

ubitricity has developed a compact charging solution by integrating charging facilities into urban lamp posts. This inexpensive solution enables nationwide establishments of charging infrastructures.

In the UK, ubitricity is the provider with the most public charging points. ubitricity's lamp post charge points, which are particularly compatible with the urban landscape, are offered in public spaces in London, Liverpool, Oxford, and Portsmouth, among other cities. All users are granted non-discriminatory access and are billed according to consumption.

In October 2021, ubitricity also launched a standard-compliant EV lamp post charge point for the German market. With the growing need for smart grids in mind, the ubitricity charging solution, with its longer connection times, forms the basis for making an e-vehicle available to the energy grid as intelligent storage - an essential building block for the energy transition.

## Different target groups benefit from charging and billing solutions

**Smart cities:** Nationwide expansion of public charging infrastructure with kWh-accurate billing. ubitricity assumes the role of hardware provider, charging point operator and mobility service provider.

**Charging point provider:** Development of low-cost charging infrastructure with billing services with low operating costs.
